Introduction

Overall, the guidance serves as a reference to help users understand how data extracts can enhance the data analysis process for their agency and as a result, better utilize PEMS software as a tool to help answer monitoring and evaluation questions. More information on monitoring and evaluation can be found in soon-to-be-released documents and trainings from both the Program Evaluation Branch and the Capacity Building Branch in the Division of HIV/AIDS Prevention.

PEMS Data Extracts Guidance is a technical guidance for data extracts. The data variable details in this guidance are provided to help users understand data extracts and use them effectively in linking and analyzing data. In addition, this information can help agencies identify which data extracts will meet their data needs for monitoring and evaluation of their programs. The guidance also is intended to help PEMS software users (1) understand the data within the extract, (2) understand the relationship between the data extract that is requested and the data extract that is returned, (3) link data extracts, and (4) import the data extracts in Excel and SAS.

How this Guidance is Organized

This guidance is divided into sections associated with the data extract files created using the PEMS extract functionality. Each section includes an extract dictionary that describes a specific extract and each related variable. Additional details are provided for extracts with specific records in one file that correspond to specific records in another. For each variable, the following attributes are provided:

- Key – Determines a unique identifier for this table (Y/N)
- Variable Name – Name assigned to the variable
- Type – Character or Numeric Data Type
- Format – If formatted, the format used for this variable
- Label – An abbreviated description of the variable
- Valid Values – These are the valid values allowed for the variable

Overview of PEMS Data Extracts

The PEMS data extract functionality includes online and offline processing. Online processing is provided when users submit data extract requests to PEMS. Offline processing is provided using a batch schedule in which user's data extract requests are processed during night and weekend hours. The requests are kept in a queue until processing begins and are processed in the order they were received.

Once the data extract is available from PEMS, the files that the user receives are in a Semicolon Separated Value (SSV) file format. These data extracts can be imported into software packages such as Microsoft Excel or SAS.

Importing Data Extracts into Excel

The process for importing data extracts into Microsoft Excel is as follows:

1. Start Microsoft Excel.
2. Click the "Open" Folder icon.
3. Find the data extract file (you may have to choose "All files (*.*)" in the Files field for the type that you want to open, highlight and click "Open."
4. Click "Delimited", and click "Next." Before clicking "Next" you can choose where Excel starts to read the extract by increasing the "Start import at row" to another number. There is header information in the first 3 rows that will not be seen if this number is any other number except 1.
5. In the delimiters section, check "Semicolon" and make sure no other delimiters are checked, and then click "Finish."

After following these instructions, an Excel file will open and you can look at your data extract. The first three (3) lines include the data extract name and the requested start/end dates of the extract. The fourth line describes the column names for subsequent records. This file can be saved as an Excel file.

Importing Data Extracts into SAS

For users that want to import data extracts directly into SAS, a general description of the DATA STEP that can accomplish this import is as follows:

Data extract1;
    Infile "C:\Extract folder\general_budget_information_1234567" DLM=';' DSD LRECL=1000 TRUNCOVER FIRSTOBS=5;
        This infile statement states the specific extract that the user wants to import. The DLM states that a semicolon is the delimiter. FIRSTOBS=5 will make the program start creating records from the 5th row of data extract.

    Input A01a_SYS_GEN :8. A01 :$45. A11 :8. A15_VC :8. A16 :MMDDYY10. A17: MMDDYY10. A15 :8. A20 :8.;
        This input statement assigns a name and format to the variables read from the data extract. The order of the variable names and formats is very important. For example, if the first variable in the data extract is A01a_SYS_GEN and the user writes "Input A15 :8. A01a_SYS_GEN :8. etc" in the DATA STEP, the first variable will be assigned the name A15 but have the A01a_SYS_GEN data. To ensure the proper order of this statement, it is recommended that the user import the data extract into Microsoft Excel to help guide the order of this statement.

    If A01a_SYS_GEN=. then delete;
        If you look at the data extract in Microsoft Excel, the last line states "Total Number of Records." This program sees that statement and reads it as a record, so this statement deletes this record since it is not truly a record.
    Run;

Notes:

When a risk profile is edited, a new record is created with a new system-generated ID number. Within PEMS, only the most current "active" version of the risk profile can be viewed but earlier "inactive" versions display in the data extract.

Some of the variable names in this extract are unusually long and SAS has a maximum name length of 32 characters. If you look at the extract in Microsoft Excel, the variable names may be a little longer and may have the '/' in the name. SAS does not allow this and the '/' have been replaced with a '_'.

This extract can also be merged / joined with the Session Details extract. The key variables needed for this merge/join are:
- G102_SYS_GEN and G200 from Risk Profile.
- G102_SYS_GEN, H06, H07, and H08 from Session Details. H06, H07, and H08 must be used to create a G200 variable in this dataset to merge/join with Risk Profile.

Detailed Behavior Details

Description:
The Detailed Behavior Details extract contains client risk factors at specific recall periods. The recall periods identified are 15 days, 30 days, 90 days, and a locally-defined recall period. Variables from this dictionary can be found in the Client Level Services Module in PEMS.

Notes:

This extract has one record for each recall period.

Some of the variable names in this extract are unusually long and SAS has a maximum name length of 32 characters. If you look at the extract in Microsoft Excel, the variable names may be a little longer and have the '/' in the name. SAS does not allow this and the '/' have been replaced with a '_'

This extract can be merged/joined with the Session Details extract. The key variables needed for this merge/join are:
- G102_SYS_GEN and CLIENT_SESSION_ID_SYS_GEN from Detailed Behavior Details
- G102_SYS_GEN and SESSION_ID_SYS_GEN from Session Details. A specific recall period for I01_VC must be selected to ensure one record is pulled from Session Details.

Confirmed HIV Status

Description:

Notes:

This extract can be merged/joined with the Risk Profile extract. The key variables needed for this merge/join are:

- G102_SYS_GEN and G200 from Risk Profile
- G102_SYS_GEN, H06, H07, and H08 from Session Details. H06, H07, and H08 must be used to create a G200 variable in this dataset to merge/join with Risk Profile

This extract can also be merged/joined with the Detailed Behavior Details extract. The key variables needed for this merge/join are:

- G102_SYS_GEN and CLIENT_SESSION_ID_SYS_GEN from Detailed Behavior Details.
- G102_SYS_GEN and SESSION_ID_SYS_GEN from Session Details. A specific recall period for I01_VC must be selected to ensure one record is pulled from Session Details.
